

Arc suppression coil and grounding transformer relay protection settings

Overview

Relay Arc Suppression: Connect CMS varistors across relay contacts to clamp transient voltage, preventing arcing and contact welding. The transformer core defines an additional path for carrying magnetic flux between the opposite ends of the three limbs. Setting procedures are only discussed in a general nature in the material to follow. However, due to their. Abstract: Guidelines for protecting three-phase power transformers of more than 5 MVA rated capacity and operating at voltages exceeding 10 kV is provided to protection engineers and other readers in this guide. In some cases, a user may apply the techniques described in this guide for protecting. In most cases the 110% NL limit is more restrictive than the FL limit and would be plotted on the coordination curve set unless the GSU impedance is $< 7\%$ or so (Z_t at max GSU MVA rating).
