

Core switch lights up red when power is off

Overview

The issue is when the CPU LED remains solid red, blinks repeatedly, or the system refuses to boot while the CPU light is lit. Before troubleshooting, shut the PC down completely and switch off the power supply using the rear PSU switch. Unplug the power cable from the wall or power. A red CPU light on your motherboard is one of the most alarming PC troubleshooting signs because it usually appears before the system can boot or show anything on the monitor. The good news: it does not always mean your processor is dead. Power LED flashes quickly after power on, flashing 4 times per second (no memory or memory error) B. This is useful for reporting the general. HDD status light probably So that would mean the hdd isn't working?

No - it indicates the drive is accessing data. They blink as a result, much like the little green lights on the corner of your RJ45 port on your desktop when the ethernet cable is plugged in and online - or lights on a networking. CPU led was red after I stopped the blades by hand it started blinking and tried to spin the fans up again even if the power cables pulled off, so it get power from the PCI slot. Error code D4 (or 04, anyway it is the " PCI resource allocation error. ") but it wasn't so bright as. Also to install the WiFi Antennas do I need to install anything and will I have 2 put the antennas on when pc is off?

You can turn it off in BIOS You can either have it on all the time or off all the time, no option to have it off when PC is powered down. It's been driving me nuts as well.
