

Dedicated lines require optical modules

Overview

Optical modules, also known as optical transceivers, are essential components that convert electrical signals to optical signals and vice versa. They form the backbone of long-distance, high-capacity data transport in modern telecom networks. Deployed across fronthaul, midhaul, and backhaul. An Active Optical Network (AON) is a point-to-point network architecture where individual dedicated fibers connect directly from a central hub (like an ISP's central office) to each end-user. Ethernet layer: business as usual. 400GE or 4x100GE breakout Optical channel:. The QDD Optical Line System (OLS) is a new pluggable optical amplifier that interconnects two routers or switches for transmitting traffic on a limited number of coherent optical channels over a single span point-to-point link.
