

Distribution Box Lifter

Overview

Box lifters are essential tools in modern logistics, manufacturing, and distribution centers, commonly used for the precise tasks of loading, unloading, and cardboard boxes that typically weigh up to 50kg each. An Electric Box Lifter is a motorized lifting device designed to raise, lower, and transport boxes or other packaged goods with minimal human effort. Operating on electric power, these lifters are often equipped with adjustable forks, platforms, or suction devices to handle different box shapes and sizes. A TAWI box lifter is designed to solve the most demanding box-handling challenges across logistics, manufacturing, warehousing, and distribution. Vacuum lifters remove the weight from workers, so they can move boxes quickly without physical strain while maintaining control and accuracy. These devices come in various sizes, models, and lifting capacities, but they all share one primary function: making the process of handling boxes. Our box lifters offer a wide range of functions and options to meet your specific requirements. Infinitely variable height adjustment is included as standard in all our models and enables precise and safe height adjustment for lifting heavy loads.
