

How to connect the electrical distribution boxes on different floors of a construction site

AI Overview

To connect distribution boxes on different floors, use a main distribution board on the ground floor with sub-distribution boards on each floor, ensuring proper wiring, circuit protection, and compliance with safety standards.

Main and Sub-Distribution Setup For multi-story buildings, the recommended approach is to install a main distribution board (MDB) on the ground floor, which receives power from the main energy meter. From this board, separate feeder cables are routed to sub-distribution boards (SDBs) on each floor. Each SDB then distributes electricity to branch circuits for lighting, sockets, and equipment on that floor. This setup allows for easier maintenance, load management, and isolation of faults.

Wiring and Circuit Protection Feeder Cables: Use appropriately rated cables to carry the total current from the main board to each floor's sub-board. Ensure the cable size matches the expected load to prevent overheating and voltage drop.

Circuit Breakers and Fuses: Install a main breaker at the MDB and individual breakers at each SDB. The main breaker should handle the total load of all floors, while sub-board breakers protect individual circuits.

Grounding and Neutral: Maintain proper grounding and neutral connections across all boards. Each floor's SDB should have a dedicated neutral and ground bus bar connected to the main system.

Installation Considerations Placement: Install distribution boxes in dry, ventilated, and accessible areas, away from water, flammable substances, and corrosive materials.

Height and Accessibility: Industrial or construction site boards should be mounted at a height that allows safe access for electricians, typically around 1.5 meters for residential setups, adjusted for industrial needs.

Labeling: Cle...
