

How to wire the switch on the distribution box

AI Overview

To wire a switch in a distribution box, connect the incoming phase and neutral to the main switch, then route power through protective devices to branch switches, ensuring proper earth and neutral connections.

Step-by-Step Wiring Process

- 1. Safety First** Always turn off the main power supply before starting any wiring to prevent electric shock. Verify with a voltage tester that no live current is present.
- 2. Mount the Distribution Box** Secure the distribution box to a wall at an accessible height, ensuring it is free from obstructions and moisture.
- 3. Identify Components**
 - Main Switch (MCB or DP MCB):** Controls overall power.
 - RCCB/RCD:** Provides protection against earth leakage.
 - Branch MCBs or switches:** Protect individual circuits.
 - Busbars/Neutral/Earth links:** Distribute power safely to all circuits.
- 4. Connect Incoming Supply**
 - Connect the phase (live) wire to the input terminal of the main switch.
 - Connect the neutral wire to the neutral link or input of the main switch if using a DP MCB.
 - Connect the earth wire to the earth link or metallic body of the box.
- 5. Wiring Through Protective Devices**
 - From the output of the main switch, connect to the input of the RCCB.
 - For branch circuits:
 - Single-pole MCBs:** Connect only the phase wire from RCCB output to the MCB input; neutral goes to the neutral link.
 - Double-pole MCBs:** Connect both phase and neutral from RCCB output to the MCB input.
- 6. Connect the Loads**
 - For each load, connect the phase wire to the output of the corresponding MCB.
 - Connect the neutral wire to the neutral link and the earth wire to the earth link.
- 7. Organize and Secure Wires** Use plastic ties to bind wires neatly, maintaining uniform spacing and avoiding kinks. Ensure wiring direction: left side for incoming connections, right side for outgoing circuits.
- 8. Testing and Safety Inspection** After wiring, use a multimeter to check for continuity, correct voltage, an...
