

Optical Coupler Zero-Crossing Detection Circuit

Overview

A zero crossing detector is an essential circuit used in AC signal monitoring and control applications. The given circuit uses an optocoupler IC of 4N35 for safe isolation between the high voltage AC mains and low voltage digital electronics. 1 shows the relationship: pulses occur at 0° , 180° , and 360° of the sine wave. 1 Zero-crossing pulse timing relative to AC sine wave by Lewis Loflin A zero-crossing detector generates a sync pulse at the AC voltage phase angle — commonly used in. MOC304X series also used to operate the external TRIACS, SSR, and MOSFETS. It detects a zero voltage reference point of the AC signal or a sine wave that is a zero crossing point of.
