

Relay protection device restarts after power failure

Overview

This innovative device is engineered to automatically restart motors after momentary power drops, effectively bypassing the start switch to re-energize your system without manual intervention. ROCKFORD, IL, JULY 19, 2022 — In order to meet certain regulations, and as a best safety practice, machinery must be prevented from automatically or unintentionally restarting when an unscheduled power interruption occurs. To explain this concept, let's take, for example, a regular light switch that you may find on the wall. Anti-automatic restart (undervoltage) protection without the high cost of magnetic motor starters The following standards apply to machines driven by 120 and 240 volt fractional horsepower motors: "On applications where injury to the operator might result if motors were to restart after a power. An anti-restart device is a safety mechanism designed to prevent the unintended restarting of machinery or equipment following a power interruption. The selection and applications of.
