

Screen Switcher KVM

AI Overview

A KVM switch allows you to toggle between multiple computers using a single keyboard, mouse, and monitor setup, either via buttons on the switch or keyboard hotkeys.

Setting Up Your KVM Switch

Connect Monitors: Plug your monitors into the KVM switch using the appropriate cables (HDMI, DisplayPort, or USB-C) for each display. For dual-monitor setups, each monitor must be connected separately to the KVM switch.

Connect Computers: Attach the video output ports from each computer to the corresponding input ports on the KVM switch. If your computer has only DisplayPort outputs and your KVM uses HDMI, use a DisplayPort-to-HDMI adapter.

Connect USB Peripherals: Plug your keyboard, mouse, and any other USB devices into the designated USB ports on the KVM switch. For high-power devices like 4K webcams, use USB 3.0 ports if available.

Power On: Connect the KVM switch to a power source and turn it on. Then power on your computers and monitors. Ensure all devices are recognized and functioning properly.

Switching Between Screens

Physical Button: Most KVM switches have a button on the device itself. Pressing it cycles through the connected computers, switching the display, keyboard, and mouse control to the selected system.

Keyboard Hotkeys: Many KVM switches support hotkey combinations (e.g., pressing Scroll Lock twice followed by a number key) to switch between computers without touching the switch. Check your KVM's manual for the exact key sequence.

Remote or Software Control: Some advanced KVMs allow switching via a remote control or software interface, which can be convenient for multi-monitor setups or when the switch is not easily accessible.

Tips for Smooth Operation

Check Cable Quality: Use cables that meet your resolution and refresh rate requirements (e.g., 4K60Hz HDMI for high-end monitors) to avoid flickering or signal loss.

Verify Compatibility: Ensure your keyboard, mouse, and monitors are compatible with the KVM switch, especially if using wireless peripherals.
