

Small electrical distribution boxes for construction sites

AI Overview

Construction sites commonly use portable spider boxes, connection cabinets, and compact socket distributors to safely distribute temporary power. Portable Spider Boxes Portable spider boxes are compact, mobile units designed for small to medium construction operations. They typically provide multiple outlets for 120/240V single-phase or 120/208V three-phase power and are ideal for powering hand tools and small equipment. These boxes are lightweight, easy to transport, and often feature built-in circuit breakers for overload protection, making them a versatile choice for temporary site power (). Connection Cabinets Connection cabinets serve as central hubs for temporary power distribution. They are connected to the public supply or a generator and can measure energy consumption while distributing power to downstream boxes. These cabinets often include CEE and earthed sockets, upstream safety devices, and are designed for outdoor use with robust housings. They are suitable for larger sites where multiple distribution points are needed (). Connection Distributors Connection distributors are intermediate units that receive power from a connection cabinet and distribute it to smaller boxes or directly to equipment. They are often portable, weather-resistant, and equipped with circuit breakers and residual current devices (RCDs) to ensure safety. These units are commonly used for lighting, cranes, or temporary structures (). Socket Distributors Socket distributors are compact, portable boxes used to supply power directly to hand-operated tools and small machinery. They are designed for quick deployment, often with weatherproof covers and IP-rated connectors to protect against moisture and dust. These units are ideal for short-term or flexible power needs on construction sites (). Weather-Resistant and IP-Rated Units Many small distribution boxes are weatherproof, with IP...
