

The function of the pigtail anti-loss clip

Overview

The bare end of the pigtail is spliced to the main cable, creating a permanent, low-loss connection. This splicing process helps integrate fibers into panels, switches, and transmission equipment without excessive bending or physical strain. 5m to 2m—that has a factory-terminated connector on one end and bare fiber on the other end., switches, routers, transceivers) to passive components (e., patch panels, ODFs) or other devices. Get the wrong connector type, the wrong polish, or skip proper fusion splicing technique—and you're looking at elevated signal loss, increased back reflection, and a. The main advantage of a pigtail is that the connector is factory-terminated and polished under controlled conditions. That produces more consistent geometry, lower insertion loss, and higher return loss than a field-terminated connector. The splice itself adds roughly 0.
