

What is the wire connected to the distribution box called

Overview

Distribution box The connection wire between the box door and the box body is usually called braided soft copper wire. And all the switching and protective devices are installed in the distribution box. This wire is mainly used for the electrical connection between the metal box door and the metal box body of the distribution box to ensure reliable grounding and prevent leakage. A distribution box is a low-voltage electrical enclosure that receives incoming power and distributes it safely to multiple outgoing circuits through protective and switching devices such as MCBs, RCDs, RCBOs, fuses, isolators, busbars, neutral bars, earth bars, and surge protective devices. If you know. The answer is simple, but profound: An electrical box is defined by its mission, not its material. It's called. Every wire in your home — every socket, every light, every appliance circuit — traces back to a single grey box on the wall: the distribution board, also called a consumer unit or, in older installations, a fuse box.
