

# What router do you need for a 500 Mbps fiber optic connection

## AI Overview

For a 500 Mbps fiber connection, a Wi-Fi 6 (802.11ax) router with dual-band support, Gigabit Ethernet ports, and strong range is recommended.

**Key Requirements**

- Wi-Fi Standard:** Choose a router that supports Wi-Fi 6 (802.11ax), as it provides higher throughput, better efficiency for multiple devices, and improved real-world speeds compared to Wi-Fi 5 (AC) routers.
- Frequency Bands:** A dual-band router (2.4 GHz + 5 GHz) is essential. The 5 GHz band offers faster speeds and less interference, which is critical for achieving near 500 Mbps performance over Wi-Fi.
- Ethernet Ports:** Ensure the router has Gigabit WAN and LAN ports to handle the full fiber speed for wired connections. Multiple LAN ports allow direct connections for devices like gaming consoles or PCs, reducing Wi-Fi congestion.
- Range and Antennas:** For larger homes or multi-floor setups, select a router with multiple antennas or a mesh Wi-Fi system to maintain strong coverage throughout the house.
- Device Capacity:** If you have many devices, look for routers with OFDMA and MU-MIMO technology, which efficiently manage multiple simultaneous connections.

**Recommended Router Models**

- TP-Link Archer AX6000 – Wi-Fi 6, dual-band, 8 Gigabit LAN ports, strong range, suitable for multiple devices.
- ASUS RT-AX88U – Wi-Fi 6, dual-band, 8 LAN ports, excellent for gaming and streaming.
- Netgear Nighthawk AX8 (8-Stream) – Wi-Fi 6, dual-band, high throughput, good for large homes.
- Linksys Max-Stream AX6000 – Wi-Fi 6, dual-band, robust performance for multiple users.
- Reyee AX3200 Mesh Wi-Fi System – Wi-Fi 6, dual-band, mesh coverage up to 6,000 sq. ft., supports 150 devices.

**Additional Tips**

- Avoid older Wi-Fi 5 routers, even if they claim high theoretical speeds, as they often cannot sustain 500 Mbps in real-world conditions.
- For optimal performance, place the router centrally and minimize physical obstructions between...
